

Matias Gonzalez

Backend Developer | Python · Django · Django REST Framework

matiaszequielgonzalez365@gmail.com | +54 9 11 7036-3429 | Buenos Aires, Argentina | github.com/matiasglez

Professional Summary

Backend developer in training, focused on Python, Django REST Framework, and PostgreSQL. Built and deployed a REST API for an e-commerce platform, including JWT authentication and Mercado Pago payment integration, documented with OpenAPI/Swagger. Additional training from Harvard (CS50P). Looking for a first opportunity as a Backend Trainee/Junior Developer, open to on-site, remote, or hybrid work.

Technical Skills

- **Languages:** Python
- **Frameworks / Libraries:** Django, Django REST Framework, SimpleJWT
- **Databases:** PostgreSQL
- **Deployment / Infrastructure:** Render (backend + database), Vercel (frontend)
- **Tools / DevOps:** Docker, Git, GitHub, GitHub Actions
- **API Documentation:** OpenAPI / Swagger (drf-spectacular)
- **Security & Payments:** JWT authentication, HMAC-SHA256 signature verification, payment gateway integration

Projects

Volt — E-commerce API (Django REST Framework)

Demo: volt-matiasglez-ecommerce.onrender.com/api/schema/swagger-ui | Frontend: volt-store-plum.vercel.app/login

- Designed and shipped a 26-endpoint REST API across 5 modules (users, products, cart, orders, payments), backed by 9 models and 17 database tables.
- Delivered the full project independently in 18 development days (about 45 hours) across 90 commits.
- Wrote 78 automated tests covering authentication, catalog, cart, checkout, and payment flows, including concurrency and duplicate-webhook edge cases.
- Prevented overselling during checkout using pessimistic row locking, keeping stock accurate when multiple users buy the same product at once.
- Verified payment webhooks with HMAC-SHA256 signatures and a fail-closed policy, rejecting any notification without a valid signature.
- Eliminated duplicate charges by making webhook processing idempotent, so retried notifications never create a second transaction.
- Built a dual payment flow with live Mercado Pago and a custom mock gateway, enabling full offline testing of checkout.
- Automated order expiration with a 15-minute lazy timeout that cancels stale orders and restocks inventory automatically.
- Implemented a self-referencing category hierarchy with unlimited subcategory levels and automatic slug collision handling.
- Built a custom authentication system with stateless JWT and email-based login instead of username.
- Documented all 26 endpoints with OpenAPI/Swagger and deployed the full stack to production on Render and Vercel.
- Directed an AI-assisted frontend build through iterative prompting and manual review, shipping a working end-to-end client while staying focused on backend engineering.

Certifications

- **CS50P: Introduction to Programming with Python** — Harvard University (David J. Malan), 2026
- **Python 3 and Web Development with Django/Flask** — Udemy (Victor Robles), 30.5 hours, 2024

Languages

- Spanish — Native
- English — Intermediate, currently improving (formal course + self-study)

Education

University Technician in Programming — Universidad Nacional Guillermo Brown (UNaB)

In progress - 2nd semester - Started 2026 - Expected graduation 2029
